About Presien

1 HUMANS NEED SUPPORT TO ENSURE SAFETY

We humans are pretty intelligent beings. The way our ideas and ambition and tenacity have advanced engineering, humanities, and sciences has been nothing short of phenomenal. All this stunning progress, but one thing remains the same:

We are still only human.

We don't have eyes on the back of our heads. We get easily distracted. We forget. We rush.

This means we'll keep making human mistakes. It's not fair to have our safety, and the safety of our co-workers, our loved ones, and our community, limited by our common human traits.

We need a new approach, where artificial intelligence fills in the gaps when our human eyes and brain can't keep up. That's why Presien created Blindsight.

Blindsight is the new standard for industrial artificial intelligence (AI) that effortlessly protects people in dynamic environments.

THE MANY IMPERFECT HUMAN AND TECH-BASED APPROACHES TO SAFETY

Human

Training

Upskilling workers improves safety but does not prevent the momentary lapses that are inherently human.

Spotters

Spotters are designated workers that assist with vehicle movement and operation. Spotters are deliberately placed in higher risk situations, where the consequence of distraction or inattention can be fatal.

Technology

Camera systems

Camera and screens are passive, only providing information to users when they are looking directly at the system.

Location systems

Location systems take action when moved into or out of designated areas but are unable to detect objects within the area.

Thermal systems

Thermal systems detect heat. However, most are unable to operate outdoors and differentiate hot vehicles and equipment from people.

Distance systems

Distance systems take action when something gets within a certain distance. Most systems are unable to identify the type of object, which causes issues in congested and busy environments.

Tag systems

Tag systems attach a physical tag to each object that is detected by one or more detectors. The logistics and costs become challenging in large and uncontrolled environments, and objects without tags are not detected.

Infrared systems

Infrared systems detect the reflection from high-vis or suitably reflective materials. Most are unable to identify the type of object and objects without reflection are simply not detected.

Motion sensors

These detect movement, using a range of passive and active technologies. However, most are unsuitable for mobile and outdoor applications due to the combination of relatively static objects of interest, such as people and plant, and background movement.

Early AI and image analysis

Early AI systems typically rely on rudimentary shape analysis for person detection and do not detect other objects, or use pixel comparison techniques that are not suitable for outdoor and dynamic environments.

2

BLINDSIGHT'S MODERN AI, BASED ON NEURAL NETWORKS, IS A STEP-CHANGE IN SAFETY SYSTEMS

Unlike humans, Blindsight will never tire or get distracted. And unlike legacy technologies, Blindsight recognises and differentiates user selectable objects in any environment without the need for physical tags, markers, reflections, movement, heat, or location. It can see and understand what you can – and it's constantly learning and improving.

Blindsight's AI automatically generates comprehensive analytics to really understand your safety – and where to improve.

THIS IS 3 BLIND SIGHT

Blindsight is the simple pre-trained AI safety system that can be quickly installed on mobile vehicles and fixed infrastructure.

When Blindsight detects a dangerous situation, such as a person in a blind spot it alerts workers, calling their attention to the risk before it turns into a costly accident. The data captured by Blindsight, including video of the situation, is available at the tap of a finger, automating health and safety reporting for the first time.

Effortlessly protect people in dynamic environments.

Features

01 Plug + Play

Blindsight is a simple plug-and-play system that can be installed and configured on vehicles and fixed infrastructure in under 10 minutes. Blindsight is equally easy to remove and reinstall, without damage.

02 Pre-trained AI

Blindsight comes pre-trained to detect people, heavy vehicles, light vehicles, and traffic cones.

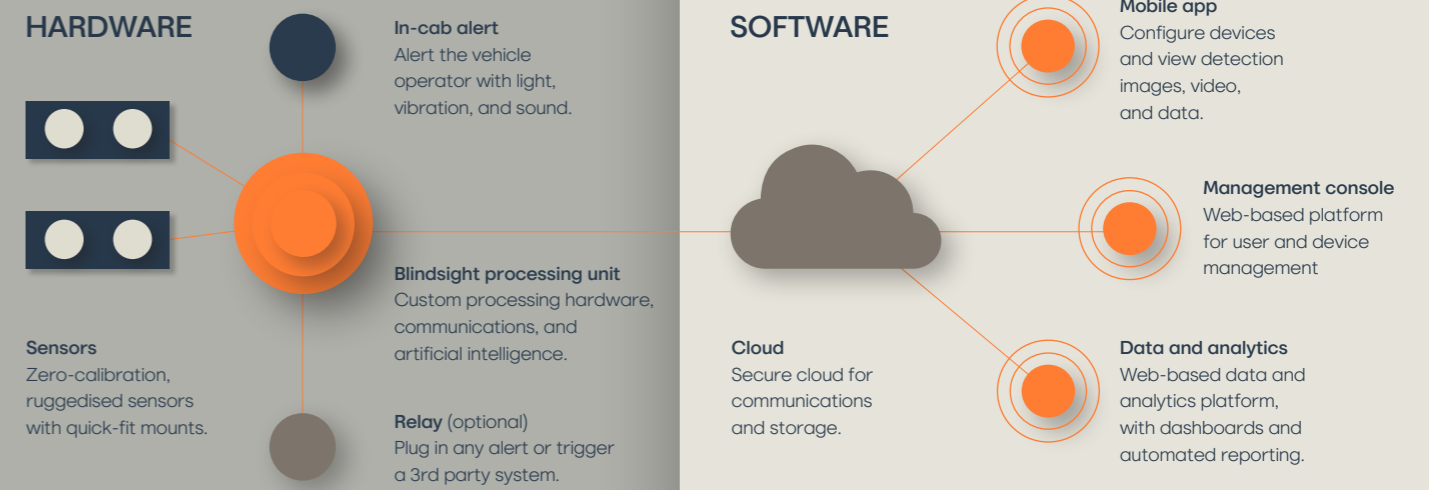

03 Simple, user configurable alerts

Blindsight comes with simple wireless alerts. The In-cab alert for plant operators has integrated lights, vibration, and buzzer. The optional Relay allows users to easily plug in and configure any other alert, such as a rooftop light, halo, or siren.

04 Connectivity

Blindsight comes with inbuilt wireless connectivity for local alerts, GPS for location, and 3/4G for data connectivity.

Blindsight does not require 3/4G or wifi to operate¹.

05 App

Blindsight comes with a companion app to easily configure the system and view detections and audit logs.

06 Over-the-air updates¹

Blindsight has over-the-air updates to automatically improve the system performance and add features.

07 Videos and logs

Blindsight automatically records video and data associated with the detections.

08 Device storage

Blindsight has internal storage for over 7 days² of detections, ensuring that your detection data is stored until the system has 3/4G connectivity.

09 Cloud

Blindsight includes a secure cloud for communications and data storage.

10 Management console

Blindsight includes a web-based console to remotely manage users and devices.

11 Data and analytics platform

Blindsight includes a full data and analytics platform that is automatically populated with your detection data stored in the cloud.

¹ 3/4G connection required for initial configuration, over-the-air updates, and reporting features.
² Internal storage duration depends on the number of detection events. Old data is overwritten if insufficient space is available for new data.

4 HOW BLINDSIGHT WORKS

1. BLINDSIGHT DETECTS

Blindsight's sensors and AI see and recognise specified objects, including people, heavy vehicles, light vehicles, and traffic cones.

2. BLINDSIGHT ALERTS

If an object is detected, Blindsight triggers the wireless in-cab and relay alerts to alert the operators and people in the vicinity.

3. BLINDSIGHT REPORTS

Blindsight simultaneously logs the detection event data (including video) and sends them to the cloud. Users can access the data on the mobile app, management console, and data and analytics platform.

For operators

Blindsight gives an operator eyes in the back of their head.

Blindsight monitors the desired areas, giving the operator confidence that a person or other specified object is not in their blind spots. Blindsight's simple alerts allow an operator to do their job without constantly monitoring screens. Blindsight supports operators and enables them to make decisions rather than removing control. Blindsight's automated reporting also ensures that any encroachments are fully documented.

For supervisors

Blindsight reduces the risk profile of works.

Blindsight's automatic detection event notifications and reporting enable a better understanding of works and risk, and shows where more attention or interventions are required.

For managers

Blindsight reduces business risk and associated direct and indirect costs.

Blindsight's automated reporting quantifies baseline risk and operational performance on individual items of plant, across a project, and across multiple projects. The data then helps understand and measure the efficacy of interventions, provides guidance on workforce training, and confirms compliance.

3

Blindsight protects some
of the biggest names in the
business.

“OUR BUSINESS INVESTS IN PURPOSEFUL
TECHNOLOGIES THAT PROVIDE GREATER
CERTAINTY FOR OUR CLIENTS. WE SEE
BLINDSIGHT AS **A POWERFUL TOOL** THAT
WILL EMPOWER PEOPLE TO MAKE THE
CONSTRUCTION INDUSTRY MUCH SAFER.”

Cathal O'Rourke
Managing Director
Laing O'Rourke Australia

5 WE MADE SAFETY SIMPLE

Get up and running in minutes, not hours.

GET IT ON
Google Play

Download on the
App Store

INSTALLATION

Step 1

Mount the processing module.

Step 2

Mount the sensors and connect them to the processing module.

Step 3

Mount the in-cab alert and optional relay(s).

Step 4

Connect to power.

CONFIGURATION

Step 1

Name your system.

Step 2

Create the sensor region of interest.

Step 3

Select the desired object(s) from people, heavy or light vehicles, and traffic cones.

Step 4

Configure the in-cab and relay alert behaviour.

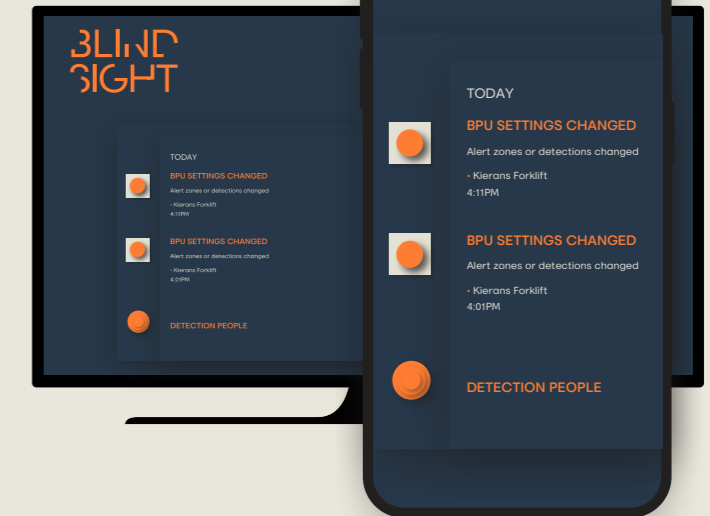

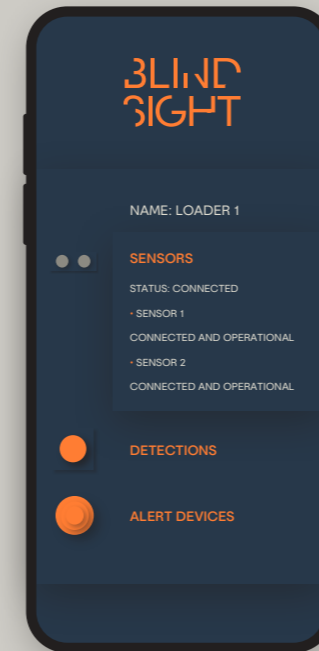

INSIGHTS

Step 1

View the logs and video on mobile app and/or management console.

Step 2

Create automated reporting in the Blindsight data and analytics platform to generate quantifiable and actionable insights.

6 WE MADE SAFETY FLEXIBLE

MOBILE PLANT

Install Blindsight sensors, processing module, and alerts on the mobile vehicle to monitor blind spots and alert the operator.

FIXED INFRASTRUCTURE

Install Blindsight sensors, processing module, and alerts on fixed infrastructure, such as doorways and production areas, to alert when objects move into and out of the zone(s).

DETECT, ALERT, and REPORT in any use case with one flexible system.

MOBILE PLANT AND FIXED INFRASTRUCTURE

Install Blindsight sensors and processing module on fixed infrastructure, and alerts on mobile vehicle(s) to alert operators when objects move into the zone(s).

7

Blindsight has been built from the ground up with truly modern AI and real industry insight. Legacy technology like proximity sensors, active and passive tags, infrared sensors, motion sensors, thermal sensors, location, and pixel comparison just don't cut it anymore.

Blindsight's intelligence is provided by Presien's world-leading deep convolutional neural network (D-CNN) AI pipeline: streamlined image processing, object recognition, object tracking, object distance estimation, and application logic.

BLINDSIGHT'S INTELLIGENCE BY PRESIEN'S WORLD-LEADING AI PIPELINE

Sensor
Adaptive exposure
image intensity
normalization to
optimise detection.

Pre-processing
Automated image
quality assessment
and saliency to reject
poor quality images
and identify regions
of interest.

Object recognition
Custom deep
convolutional neural
network (D-CNN)
trained on data from
real heavy industry sites
for object recognition.

Object tracking
Recursive Bayesian
estimation and motion
modelling to track
objects through time.

**Object distance
estimation**
Stereoscopic
processing for
object distance
estimation.

Application logic
Configurable
application
logic to drive
desired output
behaviours.

Automated health monitoring
Intelligent hardware and software self diagnostics
and healing to increase system resilience.

Connection handling
Seamless edge to cloud handling to ensure
operation with intermittent internet connection.

9 ABOUT PRESIEN

This is who we are

Presien was born out of Laing O'Rourke's research and development team. This incubation within a global engineering and construction company means Presien is a technology company that really understands heavy industries. We started with deep on-the-ground understanding, then built a technology that was suited to the unique requirements of heavy industries. We believe AI is only as good as its understanding of the industry where it will be applied.

Our mission

Our singular mission is to free heavy industries from the risks that threaten the safety of their people and business. We won't stop until every person is safe.

Let's talk

We can help you revolutionise safety without the hassle of a big technology project. Let us show you how quickly Blindsight can effortlessly protect people in dynamic environments.
